DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

Name of Title: Integrated Hotel Conference Booking Suite

1. Abstract:

The Hotel Mini-Conference Booking Portal is a web-based application created to make booking meeting spaces like boardrooms in hotels simple and convenient. Users can easily explore the available spaces, use search and filter options, and choose rooms based on their needs such as capacity, price, location, and availability. The system supports flexible hourly bookings where users can select their preferred date and time slots. It also includes a real-time availability check and prevents booking conflicts, so users do not face issues like double bookings.

To improve the overall experience, users can select extra services such as AV equipment like projectors, whiteboards, microphones, and screens, along with catering options including beverages, snacks, and meals. The platform also provides discounts and special offers that help reduce the overall cost. Another useful feature is the One-Click Repeat Booking option, which allows users to quickly book the same setup again without having to enter all the details again.

The system clearly shows the full price breakdown, including room charges, selected add-ons, applied discounts, and the final total amount. Users can complete their booking through a simple form, followed by a mock payment process and instant confirmation. Features like booking history, saved rooms, notifications, and ratings make the system more useful. A calendar view is also provided to help users easily track their bookings.

On the admin side, staff can manage rooms, update pricing, control availability, and monitor bookings. The system is designed with a clean and responsive interface, making it easy to use on both desktop and mobile devices.
